#----- a neuron

```
w = tf.Variable(tf.random_normal([1]))
```

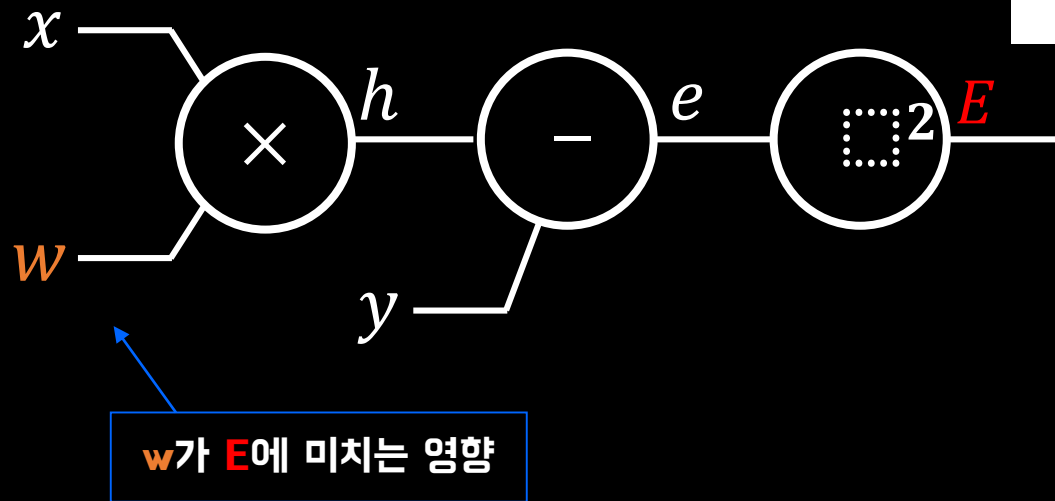

```
hypo = w * x_data
```

#----- learning

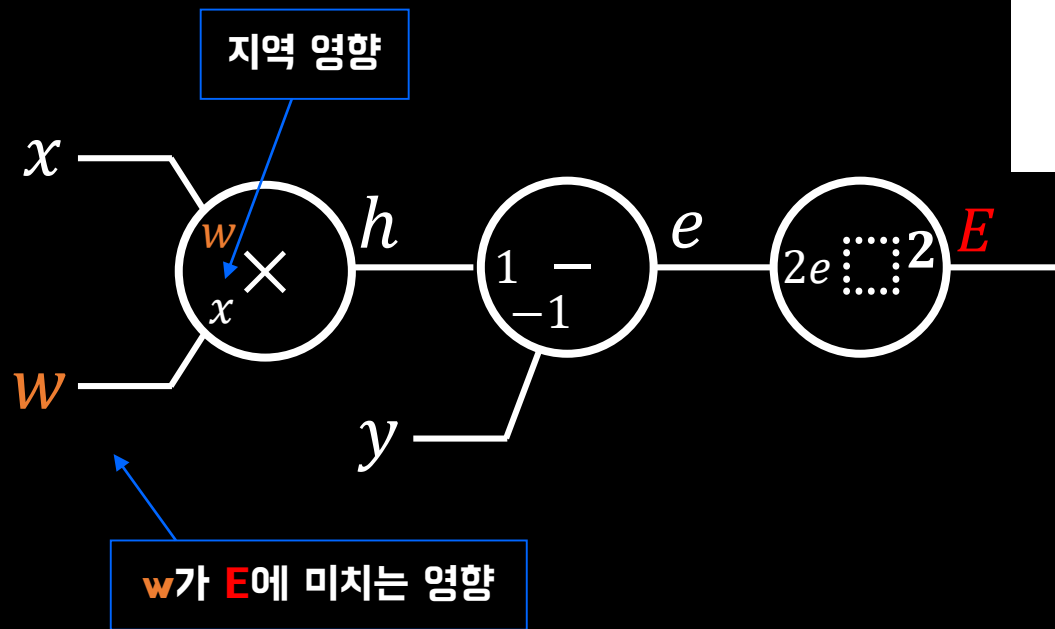

```
cost = (hypo - y_data) ** 2 #cost = Error ( $E$ )
```

$$E = (wx - y)^2$$

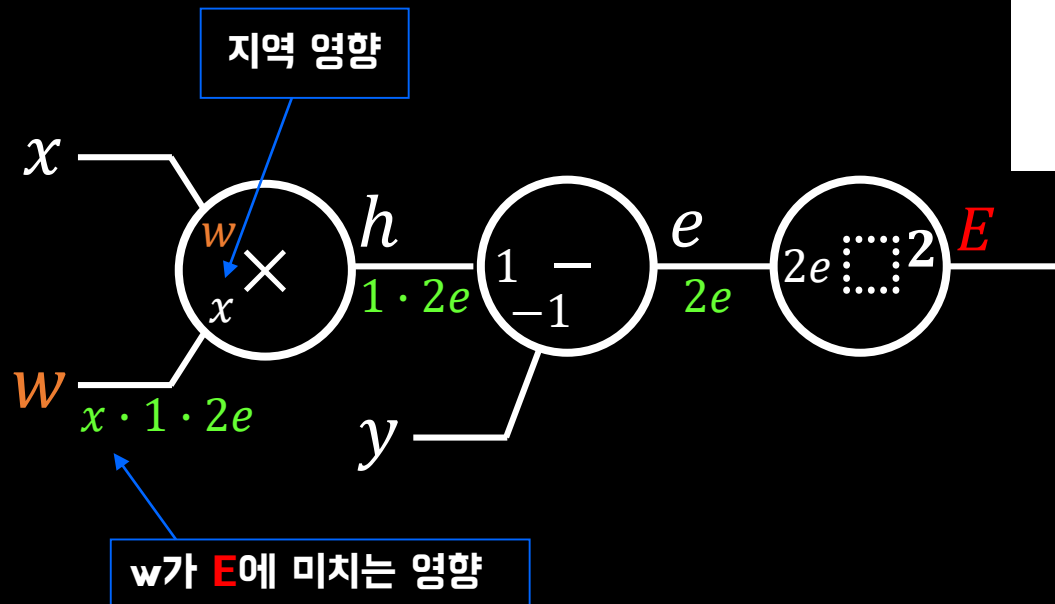

# 오류 계산 그래프

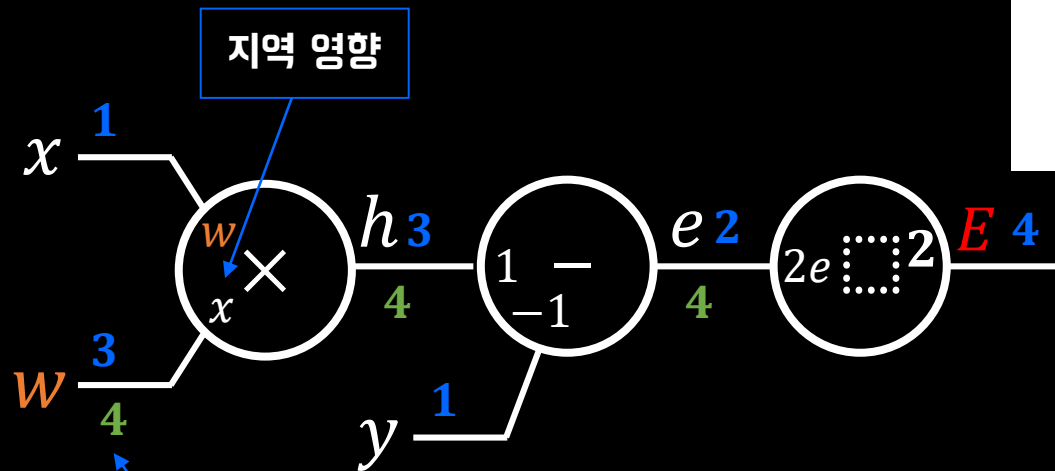

# 오류 계산 그래프

# 오류 계산 그래프

# 오류 계산 그래프

w가 E에 미치는 영향

$$1 * 1 * 2e = 1 * 1 * 2(w1 - 1) = 2(w1 - 1)$$

# 기울기, 미치는 영향

$$E = (w \cdot 1 - 1)^2$$

$$1 * 1 * 2e = 1 * 1 * 2(w \cdot 1 - 1) = 2(w \cdot 1 - 1)$$

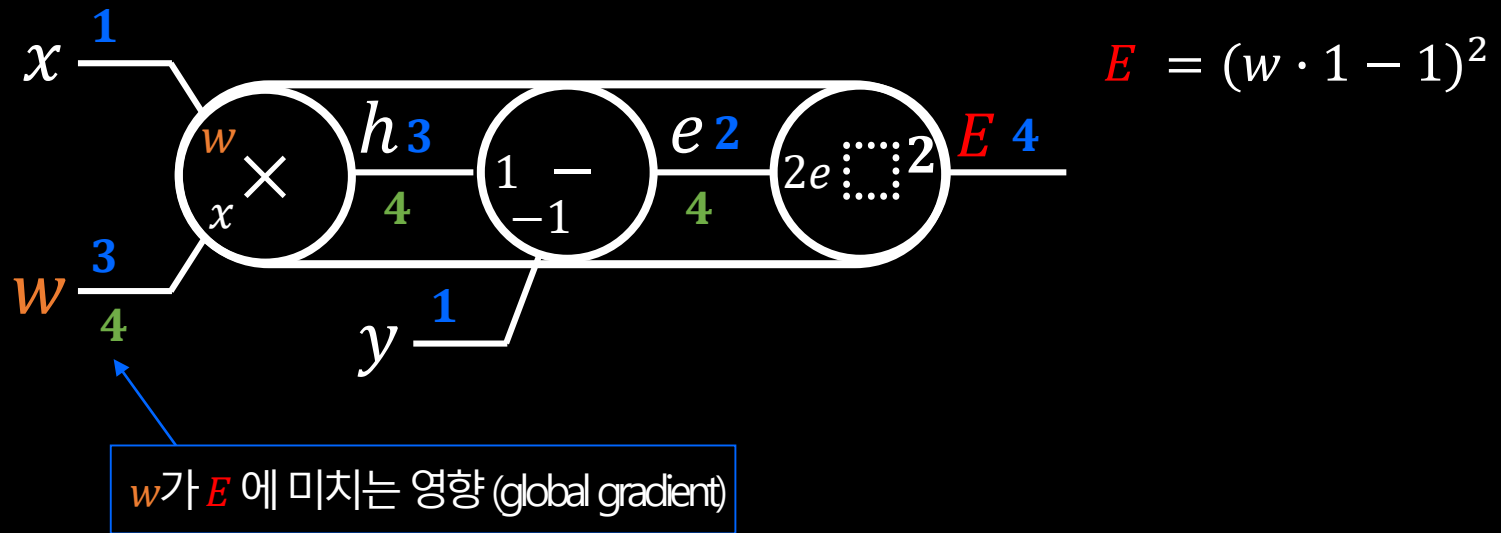

$$\frac{\partial E}{\partial w} = \frac{\partial}{\partial w} E = \frac{\partial}{\partial w} (w \cdot 1 - 1)^2 = 2(w \cdot 1 - 1)$$

# 기울기, 미치는 영향

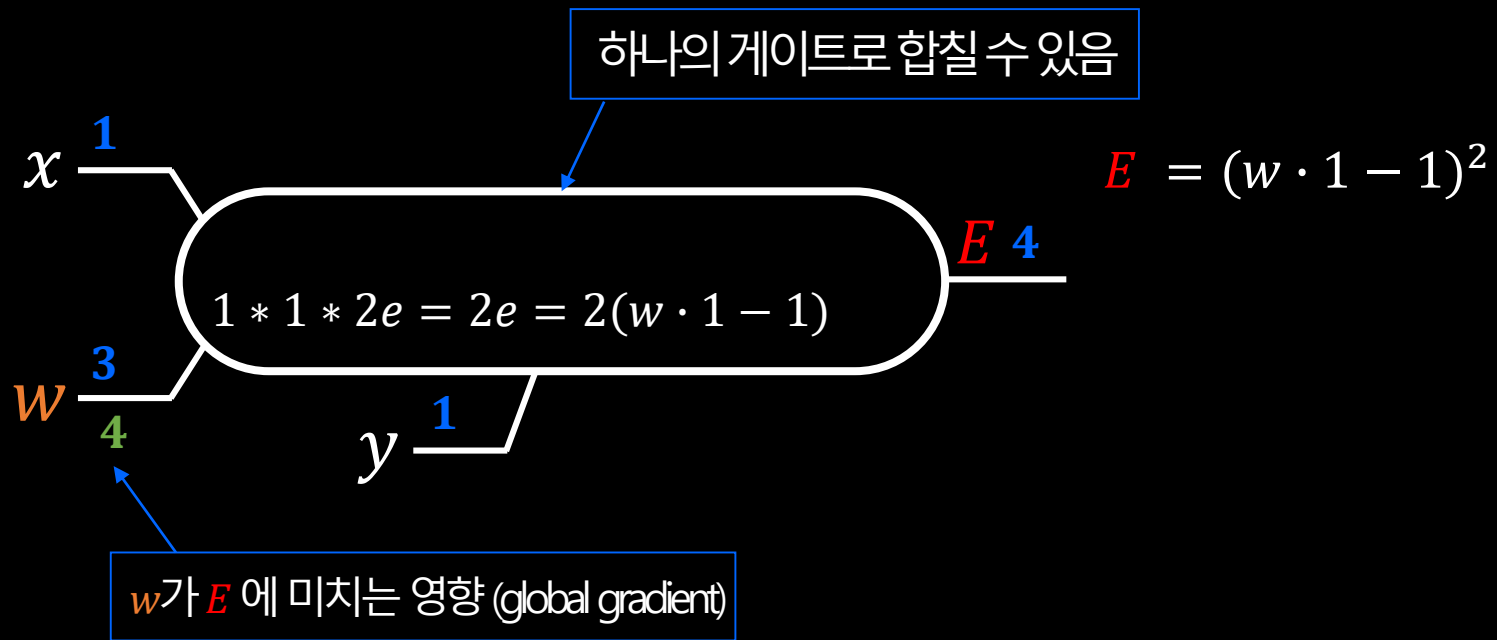

- 미치는 영향(기울기, gradient)는 어떻게 구했나?
  - 입력을 1만큼(혹은 아주 조금, 0.00001) 증가해서 출력이 얼마나 증가하는지 확인해 봄.
  - 또는 직접 미분할 수도 있음.

# 연산 합치기

# 연산 합치기

# 오류 계산 그래프

로지스틱 리그레션  
신경 세포 1개 있을 때

$$cost(E) = -y \log(hypo) - (1 - y) \log(1 - hypo)$$

$$hypo = \frac{1}{1 + e^{-wx}}$$

$w$ 가  $cost$ 에 미치는 영향은?

$w$ 를 아주 조금 바꿨을 때  $cost$ 는 어떻게 변하나?

계산 그래프를 활용하거나 또는 직접 미분하거나...

# 오류 계산 그래프

$$E = \textcircled{1} - (y \cdot \log(\text{hypo})) + \textcircled{2} (1 - y) \cdot \log(1 - \text{hypo}))$$

# 오류 계산 그래프

$$E = \textcircled{1} - (y \cdot \log(hypo)) + \textcircled{2} (1 - y) \cdot \log(1 - hypo))$$

# 오류 계산 그래프

# 오류 계산 그래프

# 사라지는 영향력

- Local gradient는 뉴런의 **sigmoid** function을 미분한 것
- **sigmoid**를 미분하면  $(1 - \text{sigmoid}(x)) * \text{sigmoid}(x)$
- **sigmoid**는 입력 값을 0~1 사이의 값으로 squash
- 따라서 0~1 사이의 값의 곱은?
- 100층 신경망의 경우 100개의 **sigmoid** 연산

# 사라지는 영향력

- $w$ 가  $E$ 에 미치는 영향은 수많은 1 이하의 곱
- 신경망의 왼쪽으로 갈수록 sigmoid가 점점 많아져서 1 이하의 곱이 많아져서  $w$ 가  $E$ 에 미치는 영향(기울기, gradient)은 거의 0
- 즉, 영향력이 사라짐 (Vanishing Gradient)
- $w = w - \alpha \times (\text{미치는 영향} \sim \text{거의 } 0)$
- 신경망의 왼쪽에 있는 뉴런들의  $w, b$ 가 거의 갱신되지 않음

# (실습) 18.py

- 4층으로 구성된 신경망으로 XOR 문제를 해결하고자 했으나 Vanishing Gradient 때문에 실패

# ReLU

Logistic 함수 대신 **ReLU**를  
사용함으로써 Vanishing  
Gradient 문제 해결

# (실습) 19.py

- ReLU를 이용하여 deep 신경망에서도 역전파 학습이 잘 됨을 보임.

# MNIST

Modified National Institute of  
Standards and Technology  
(USA)

# MNIST

# (Lab) 20.py

- 60,000 training images + 10,000 testing images
- Input image :  $28 * 28$  pixels  $\rightarrow$  784 pixels
- 784 dimension
- 10 classes (output: 0 ~ 9)
- Softmax
- 90.23% of recognition rate

Input Layer

Output Layer

# (Lab) 21.py

- Deep Neural Network (4-layer)
- ReLU
- 94.55% accuracy

# (Lab) 22.py

- 시냅스 가중치( $w$ )와 바이어스( $b$ )를 적절히 초기화
- Accuracy: 97.83%

# (Lab) 23.py

- 시냅스 가중치( $w$ )와 바이어스( $b$ )를 적절히 초기화
- Deeper (DNN) -> 6 layers
- 97.23% of accuracy

# 오버 피팅(over-fitting)

- 신경망의 깊이와 너비가 클 수록(deep & wide) 결정 경계는 매우 복잡
- 학습 데이터에 대해 지나치게 학습하여  
기가 막히게 잘됨
- 하지만 테스트 데이터에 대해서는 에러  
가 많이 남 -> 오버 피팅

신경 세포가 많을 수록(deep & wide) 결정 경계  
복잡하므로 **학습 시** 신경세포를 배제(drop-out)

## Regularization: **Dropout**

“randomly set some neurons to zero in the forward pass”

(a) Standard Neural Net

(b) After applying dropout.

*[Srivastava et al., 2014]*

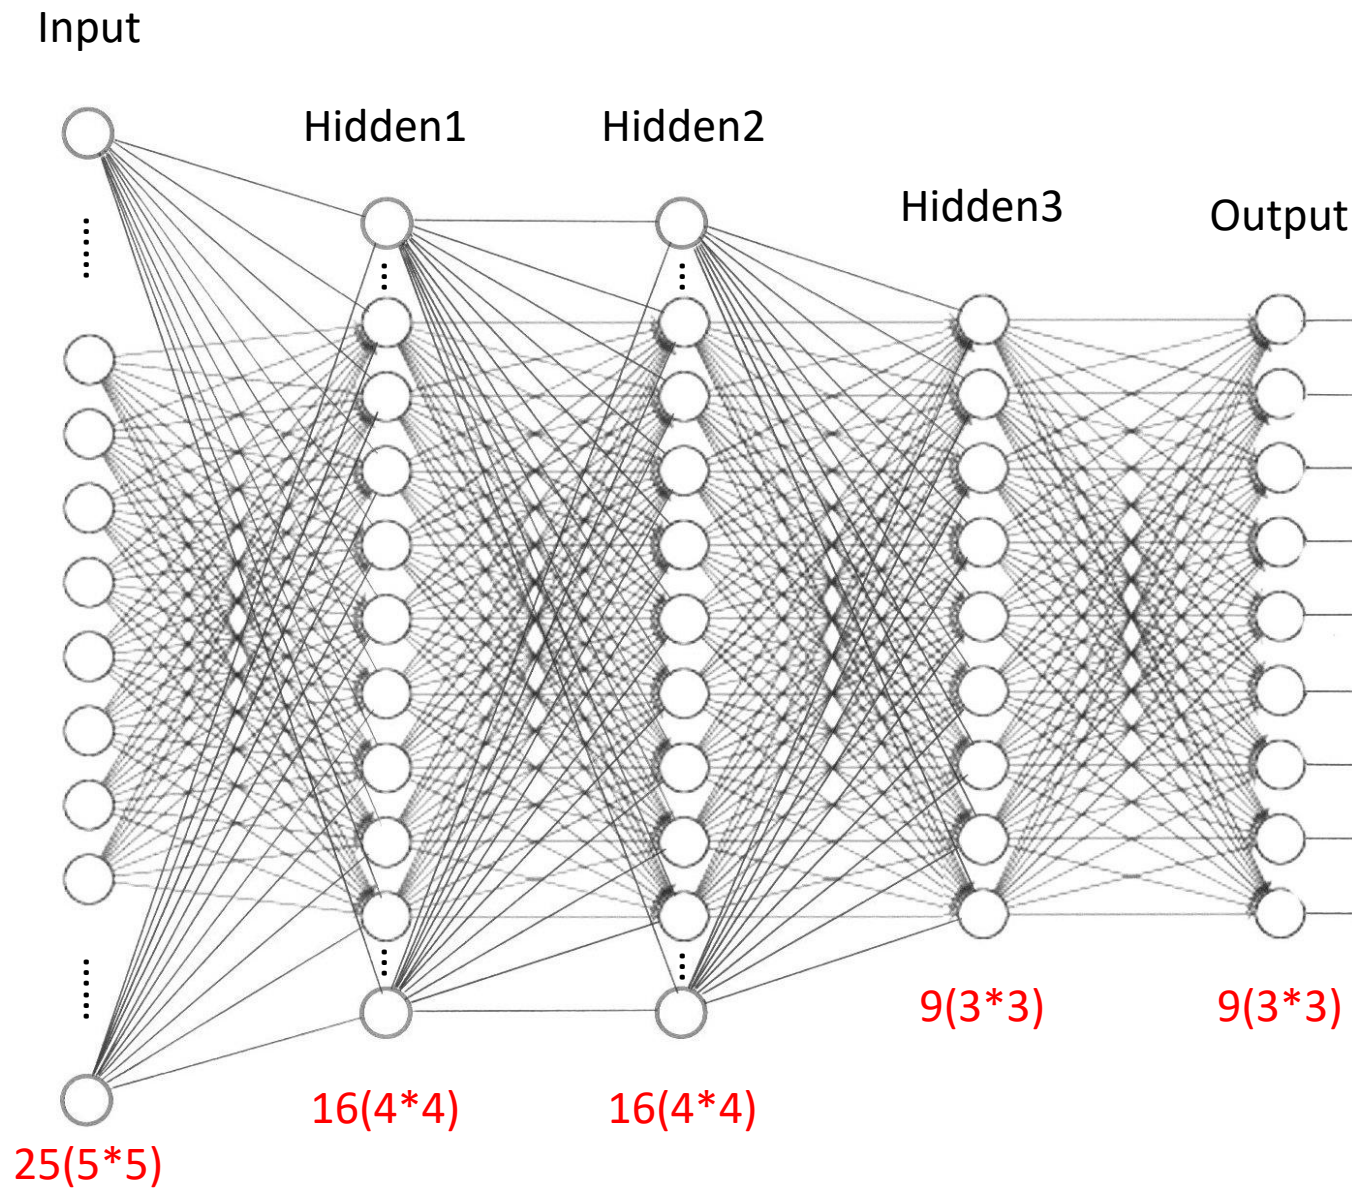

# (실습) 24.py

- 시냅스 가중치( $w$ )와 바이어스( $b$ )를 적절히 초기화
- Deeper (DNN) -> 6개 층
- Dropout
- 98.13% of accuracy

Fully connected, so how many connections(parameters) are there?

$$25 * 16 + 16 * 16 + 16 * 9 + 9 * 9 = 881$$

Fully connected, so how many connections are there?

$$25 * 16 + 16 * 16 + 16 * 9 + 9 * 9 = 881$$

Geoffrey Hinton, Yann LeCun, Yoshua Bengio, Andrew Ng
